Blessings to the Land

Significant Contribution to Turkish Agriculture from Alkim

Alkim has started the production of Potassium Sulfate again.

The biggest producer of sodium sulfate in Turkey Alkim Alkali Kimya A.Ş which

has been in the market with the motto “**The chemistry of Success**” since 1963 , has started **potassium sulfate production again**. The Chairman of the Board of Alkim Mehmet Reha Kora has stated:

” The two raw materials used in the production of potassium sulfate are sodium sulfate which is the main product of our company and potassium chloride which is imported. Since both of the products are derived from natural resources rather than chemical methods, we are targeting a product with a high added value and suitable for organic agriculture.

An advance technology has been selected for the production of potassium sulfate. With the high potassium oxide rate and 100% water solubility, potassium sulfate which is produced in Alkim is totally suitable for drip irrigation technologies. This product with an organic farming certificate will be used as a natural fertilizer in the market.

The problems in the procurement of the raw material due the war between Russia and Ukraine has been overcome with great efforts and our production has started again with Canadian origin raw material. With the awareness of the duty we undertake in the country's economy, we wish that this product, which will meet the need for natural fertilizers, which is extremely important for our agriculture, will be beneficial for our country.”
